FULL-STACK APPLICATION / DELIVERY SUMMARY

EdTech CRM & Inquiry System

A public inquiry experience and secure staff workspace, built for a complete full-stack assessment.

LIVE & VERIFIED	Netlify frontend | Render API | Supabase PostgreSQL
DELIVERY	Public inquiry form, JWT-protected dashboard, persistent PostgreSQL records

PUBLIC FORM	STAFF WORKSPACE	DATA STORE
Inquiry submission	**JWT-protected dashboard**	**Supabase PostgreSQL**

SOURCE REPOSITORY	Browse source on GitHub
API HEALTH	Check production API status

What the system delivers

PUBLIC INQUIRY FORM	SECURE ADMIN DASHBOARD
Collects user type, inquiry category, name, email, phone, and message. Country-aware phone input is validated in the browser and API.	Lists inquiries with category and user-type filters, name/phone search, received date, and editable status. Private routes require authentication.
CUSTOM AUTHENTICATION	**PERSISTENT DATA**
Express verifies credentials using bcrypt hashes, issues signed JWTs, and protects private routes with Bearer-token middleware. Supabase Auth is not used.	The Express API reads and writes PostgreSQL records through Supabase. Schema constraints and indexes support data integrity and common views.

IMPLEMENTATION / HANDOFF

Architecture & delivery

Repository links are clickable. The original assessment brief PDF is intentionally excluded from GitHub.

Architecture at a glance

LAYER	TECHNOLOGY / RESPONSIBILITY	SOURCE
Frontend	React, Vite, React Router; responsive inquiry form and staff UI.	frontend/
Backend	Express API, validation, bcrypt password hashes, JWT issuance and verification.	backend/
Database	PostgreSQL tables for administrators and inquiries; constraints, timestamps, and indexes.	schema.sql
Configuration	Runtime values use environment variables; sample contains placeholders, not production secrets.	.env.example

Assessment deliverables

DELIVERABLE	LOCATION / NOTES
Source repository	GitHub repository with distinct frontend and backend directories.
Database schema	schema.sql defines admin and inquiry tables.
Environment sample	.env.example documents configuration without production secrets.
Setup and JWT verification	README.md documents setup, admin creation, protected routes, and tests.
Live deployment	Netlify app; API runs on Render and uses Supabase PostgreSQL.
Supporting guides	docs/ includes the run guide, login guide, and 10 fictional inquiry examples.
This report	Open the latest report PDF on GitHub.

Verification

BUILD	TESTS	LIVE API
Frontend production build passed.	Backend test suite: 4 passed.	Health endpoint returned {"status":"ok"}.

Local setup

1	Copy `.env.example` to `.env`; set the Supabase PostgreSQL URL, a random JWT secret (32+ characters), and private admin credentials. Keep `.env` and credentials private.
2	Run `schema.sql` in Supabase SQL Editor, install dependencies with `npm install`, then create the admin with `npm run create-admin --workspace backend`.
3	Start both apps using `npm run dev`. Frontend: `localhost:5173`; API health: `localhost:4000/api/health`.
